T, **t**, 1 tī, 2 tē, *n* [TEES, T'S, or *Ts*, 1 tiz, 2 tēz, *pl*] **1.** A letter the twentieth in the English alphabet

It denotes the explosion made by checking the speech-current for an instant between the tip of the tongue and the upper gum, the vocal cords being inactive and the nasal passage closed It is best called a "supradental voiceless mute" The corresponding voiced mute is *d*, the corresponding nasal *n* (see under D and N) If the end of the tongue is lowered slightly from the *t* or *s* position, and the current not checked but emitted continuously between the tongue-tip and the teeth, there results the 'dental spirant" or "fricative" voiceless in *thin*, voiced in *this* These four sounds we denote respectively by t, d, th, th

By Grimm's law English *t* results normally from Indo-European *d* Lat *decem*, Eng *ten* English *t* corresponding to Latin *t* is evidence of late borrowing *temple* < Lat *templum* Several words show an inorganic *t* after *s*, cf *whilst* from *whiles*, *amidst* from *amiddes*, and vulgar *acrost* for *across* So also after *n* *tyrant* < OF *tiran*, *tirant* < Lat *tyrannus*, *parchment* < OF *parchemin* < Lat *pergamina* *T* forms the initial element of the *ch* sound, which usually results from the palatalization of earlier *k* (see under C and K) This *t* is sometimes preserved in our spelling, but often not cf *watch*, *batch*, *hitch*, but *much*, *rich* In words of Latin origin *it* early gave rise to *sh*, after *s* to *ch* cf *nation*, *question* (See under S) After *f* and *s* *t* is sometimes silent before *l*, *m*, *n* *castle*, *Christmas*, *often*

For the dental fricatives th and th the Anglo-Saxons used the letters Þ and Ð, borrowed from the runic alphabet They represent the primitive Germanic *th* which resulted from Indo-European *t* after the first mutation *three*, *thunder*, *feather*, Lat *tres*, *tonitru*, *penna* (for *pet-na*) But English *th* often represents the Greek *θ* which was an aspirated *t* (somewhat as in *hothouse*) The Romans wrote it *th*, and then dropped the aspiration so that, in medieval Latin as in the Romance languages *th* is simply another way of writing *t* Italian and Spanish have discarded this *th* with the *t* sound, but French keeps it cf It-Sp *teoria teatro*, Fr *théorie*, *théâtre* In English the Greek-Latin *th* was early merged with the Germanic *th* and the new sign drove out the old letters Þ and Ð The voiced th is much more frequent in modern English than the voiceless th — 3 83 per cent to 58 The late West Saxon inclines to use Þ at the beginning of words Ð in the medial or final position Several medial Ð s have become *d* in English *murder* < AS *morðor*, *fiddle* < AS *fiðele* The final Ð of verbs has become *s* *lufaþ* > *loves*

The *t* sound is the third in frequency in English literature, averaging 5 93 per cent according to the examination by Prof Whitney. See W D WHITNEY *Oriental and Linguistic Studies* second series p 274 [S 1874] It is the second if the pronunciation of Southern English according to H Sweet be adopted, dropping half the *r* s See R N, D It appears in the demonstrative pronouns personal endings of verbs and roots of demonstrative meaning throughout the Indo-European tongues

Tapeworms
1 The scolex of *Echinococcus veterinorum* h the hooks s the suckers 2 Proglottides of *Taenia mediocanellata*

Tapeworms have no mouth or alimentary canal, but live by absorbing the juices of their host The typical species are ribbon-like, and consist of a knot-like head (scolex), furnished with suckers, hooks, or the like for adhesion and a row of segments (proglottides) constricted off from it and progressively increasing in size posteriorly These may reach several hundred in number and form a band several yards long Each proglottis develops male and female sexual organs, and the last ones from time to time detach themselves and reach the exterior with the excrement of their host The fertilized ova are then liberated from the proglottides, enclosed in a capsule, and when swallowed by the temporary or intermediate host burst the capsule and develop into hooked embryos which bore through the alimentary canal into the tissues or into the blood-vessels, passing from the latter with the blood into the brain eye liver, *lata* etc The embryo now surrounds itself with a cyst containing a fluid and becomes a hydatid or bladder-worm from which is developed the head or scolex, which is incapable of further development until swallowed by the proper host *Taenia saginata* or *mediocanellata* is the **beef tapeworm** or **unarmed tapeworm,** of which the cystic form (*Cysticercus bovis*) is found in the muscles of the ox, and *T solium* is the **hog-t** or **armed t ,** which has two rows of hooks on the head The cystic form of this (*C cellulosæ*), as found in the muscles of hogs, is a common parasite of man *T cænurus,* cystic as *Cœnurus cerebralis* in the brain of sheep, etc , and *T serrata,* of whose cysticercus the rabbit is the host, are tapeworms of the dog The broad or Swiss tapeworm (*Bothriocephalus latus*) inhabits certain fish, as the burbot and pike, in the embryonic condition — **tape'worm-plant",** *n* Same as CUSSO, 1

> ISAAC K. FUNK *The Widow's Mite* p. 154 [F. & W. 04.]

2. That one of the senses which responds to its adequate stimulus with gustatory sensations and which thus gives the perception of the savors and flavors of different things. Since the adequate stimulus of taste is chemical, only soluble substances as far as known have any taste. The specific end-organs or receptors of this sense are the so-called gustatory buds or taste-buds situated chiefly on the upper surface and edges of the tongue but also to some extent on the soft palate and larynx. The sensory nerve-fibers which supply these organs come from three of the cranial nerves. Bitter is best tasted at the back of the tongue, and sweet at the tip, while the edges of the tongue are most sensitive to sour. Little is known as to the more precise chemical nature of the stimuli of taste. **3.** A small quantity tasted, sipped, or eaten, a little bit given to test, a sample often used figuratively. **4.** *Esthetics.* (1) The power or faculty of apprehending and appreciating the beautiful and sublime in nature and art usually accompanied by a feeling of pleasure, regarded by sensationalists as the fundamental element or even as the whole of taste, the esthetic faculty, one of the subjects treated in the science of esthetics.

Syn., artistic, chaste, dainty, delicate, delicious, elegant, esthetic, esthetical, exquisite, fastidious, fine, nice, tasty. That which is *elegant* is made so not merely by nature, but by art and culture: a woodland dell may be beautiful or picturesque but would not ordinarily be termed *elegant*. *Tasteful* refers to that in which the element of taste is more prominent, standing, as it were, more by itself, while in *elegant* it is blended as part of the whole. *Tasty* is an inferior word, used colloquially in a similar sense. *Chaste* (primarily *pure*) denotes in literature and art that which is true to the higher and finer feelings and free from all excess or meretricious ornament. *Dainty* and *delicate* refer to the lighter and finer elements of taste and beauty, *dainty* tending in personal use to an excessive scrupulousness which is more fully expressed by *fastidious*. *Nice* and *delicate* both refer to exact adaptation to some standard: the bar of a balance can be said to be nicely or delicately poised, as regards matters of taste and beauty, *delicate* is a higher and more discriminating word than *nice*, and is always used in a favorable sense, a *delicate* distinction is one worth observing, a *nice* distinction may be so, or may be overstrained and unduly subtle. *fine* in such use is closely similar to *delicate* and *nice* but (the capable of an unfavorable sense) has commonly a suggestion of positive excellence or admirableness, a *fine* touch does something, *fine* perceptions are to some purpose. *delicate* is capable of the single unfavorable sense of frail or fragile as, a *delicate* constitution. *Esthetic* or *esthetical* refers to beauty or the appreciation of the beautiful, especially from the philosophic point of view. *Exquisite* denotes the utmost perfection of the *elegant* in minute details: we speak of an *elegant* garment, an *exquisite* lace. *Exquisite* is also applied to intense keenness of any feeling, as *exquisite* delight, *exquisite* pain. tea, *n* **1** The leaves or leaf-buds of the tea-tree or tea-plant (see def 3) prepared for use or market The principal constituents of tea are a volatile oil, theın, tannin, albuminous compounds, gum, etc, and some soluble mineral matter, containing potash and phosphoric acid

Teas are named from the countries from which they are exported, as **Ceylon tea, China tea, Formosa tea, India tea, Japan tea, Java tea**, etc The different kinds and qualities of teas sold in the markets arise, not from different varieties of the plant but from (1) differences in the age of the leaf and the time of gathering, young leaves or leaf-buds gathered in spring giving the best tea (2) differences in atmospheric influences during growth or time of harvesting, sunny weather giving the best (3) differences in soil, (4) differing modes of manipulation before, during, and after roasting, leaves gathered from the same trees at the same time becoming green tea or black tea according to treatment and (5) assortment and separation or mixture of various sizes and qualities of the leaf, or processes of sifting and winnowing

The manufacture of tea formerly included as many as 12 operations, but recent methods reduce the number to 5 *withering*, by light, heat, and air *rolling*, by hand or machine *fermenting* in baskets or balls, *sunning*, done (if at all) by an hour's exposure to a hot sun and *firing*, in or over an oven or the like, to dry The difference between **black tea** and **green tea** is the result of manipulation, the latter being withered by steaming, as in a perforated cylinder or boiler, thus retaining the green color, while leaves simply dried turn black When not composed of the whole leaf teas are often distinguished as *ends, nibs fannings, broken leaf, dust*, etc Other conditions are indicated by native names as **hyson** (spring), **pouchong** (wrapped), **souchong** (small kind), etc (See list below) The importation of tea into the United States for the year ending June 30, 1911, was 102 653,942 pounds, valued at $17,613,569 Of this Japan furnished 52,998,199 pounds, China 25,148,048 pounds, and India 9 660,633 pounds

2. A beverage consisting of an infusion or decoction of tea-leaves

Tea as a beverage, if properly made, is a pure, gentle stimulant to the nervous and circulatory system Normal persons can indulge in it without harmful effects but its use should be avoided by neurotics Its principal ingredients are theın (which quickens the pulse and stimulates mental activity), tannin, an astringent aromatic oil, which gives it bouquet, and residual extract, which gives body and color A five- to seven-minute infusion develops comparatively little tannin Longer infusions are to be avoided and a second infusion should never be made from the same leaf, also tea should never be boiled

Though old Pepys did not get his first cup of *tea* till 1661, the 'Mercurius Politicus' of two years earlier has an advertisement of That excellent and by all Physicians approved, China drink called by the Chineans *Teha* by other nations *Tay* alias *Tee* is sold at the Sultanes Head Coffee-house, Sweeting's Rents, by the Royal Exchange' [London]

1 The standard legless Morse key Pressure on the button (*b*) makes a contact of the wires at *w* through the lever (*l*) which is normally upheld by the spring (*s*) If this contact is short duration a dot is made if of longer duration a dash The switch (*k*) is swung to the right when opened 2 Standard sounder The wires are connected with the receiving-magnet (*m*) through the binding-posts (*b*) and the dots and dashes from the key at the other end of the line are repeated through the rise and fall of the armature (*a*), which causes the stop (*s*) to strike the anvil (*l*) From resultant clicking sounds the message may be read by ear If the sounder is connected with a recorder, the message may be impressed on a strip of paper

Every electric telegraph consists of a *battery* or *dynamo* as the source of electricity, an insulated *wire*, single or compound, joining the two points the *transmitter* or *key* for the signals, and the *receiver* for the message The line-wire is commonly borne on poles, but sometimes carried through an underground conduit, especially in city streets It is usually grounded at both ends, the earth being utilized for the return circuit The transmitter is usually a key for making and breaking the circuit (as in the Morse system) or for reversing the direction of the current (as in the Wheatstone system), the receiver being generally in the first case an electromagnet that attracts its armature when the current is on, and in the second case a needle that changes its position according to the direction of the current The message can be sent in a system of arbitrary signals, such as the dots and dashes of the Morse alphabet, printed letters, facsimile writing (see TELAUTOGRAPH) etc, or be recorded on chemically prepared paper discolored by the electricity passing through it The invention of the electric telegraph has been a subject of much controversy It was made possible by the labors of Henry in the United States Wheatstone in England, Ampère in France Steinheil in Germany, and many others The first practical working telegraph was constructed by Samuel F B Morse of New York in 1832–1835, and his system of transmission, more or less modified, is the one still in most general use

Millions of citizens learned at their breakfast tables that the President had been shot This was the first time the *telegraph* had been called upon to spread over the world tidings of such deep and mournful significance NICOLAY AND HAY *Abraham Lincoln* vol x, p 314 [c CO 1890]

The simplest form of telephone consists of a cord drawn taut between two drumheads, sometimes called **acoustic or mechanical telephone** The ordinary electrical telephone apparatus consists of (1) a *transmitter,* in which a diaphragm, vibrated by a sound, causes rapid alterations in the strength of an electric current, (2) a wire for conducting this current to a distant point, and (3) a *receiver,* in which a diaphragm is caused to vibrate by the current, reproducing the sound In the first electric telephone to come into general use, patented by Alexander Graham Bell and known as the **magnetic telephone, or magneto-telephone,** an iron diaphragm

was caused to vibrate in the field of a magnet and near the core, so that the strength of the magnet altered periodically as the diaphragm approached and receded inducing a similarly vibrating current in the line-wire, which passed around the magnet This current by an inverse operation, caused similar vibrations in a disk in the receiver, thus copying exactly the original sound In such a telephone no battery was used Thomas A Edison devised another way to produce a vibratory current The primary current of an induction-coil is passed through a block of carbon which has the property of changing its electrical conductivity in proportion to the mechanical pressure exerted upon it The vibrating disk presses with varying force on the carbon, altering the current in the primary and hence the induced current in the secondary, which acts on a receiver similar to Bell's The Blake transmitter, an early type once widely employed, used a hard carbon block on which rested a spring attached to the vibrating disk, whose movements changed the pressure on the surface between the carbon and the platinum contact through which the primary wire was joined Its modern representative is a modification of the same principle, in which the vibration of the exterior diaphragm varies the pressure of an inner carbon plate or button upon a small receptacle filled with particles of granulated carbon, which form a number of loose joints in the path of the primary current Of this type is the White solid-block transmitter, largely used in the United States, which is considerably more powerful than the Blake while the Gower Bell transmitter, much employed in Europe, achieves the same results through the loose joints formed by eight carbon pencils arranged in sets of four in connection with one central and eight exterior carbon blocks With suitably arranged instruments it is now possible to transmit sounds upward of two thousand miles with the help of such aids to transmission as the Pupin coil See PUPIN The invention of the telephone, like that of the telegraph, has been a matter of much controversy Among the contributors to it were Reis in Germany, Hughes in England, and Gray in the United States with those mentioned above

Telephones are sometimes named from some feature of construction or operation as, **carbon telephone** (in which the diaphragm-vibrations vary, by pressure, the resistance of a carbon button), **crown t** (a magneto-electric telephone having a coil an iron diaphragm, and six permanent magnets with their like poles placed together in the center of the coil, their other poles being bent into contact with the diaphragm-edge), **dual t** (having a double receiver by which the message can be received in both ears sometimes called *bitelephone*), **electrocapillary t** (in which the impulses are sent by variations in the electromotive force caused by the impact of sound-waves upon the surface of electrodes in capillary tubes), **membrane t.** (in which the sound acts on a thin vibrating membrane or its equivalent as a very thin sheet-iron disk), **multiple t** (having several vibrating diaphragms for increasing the volume of sound), **pile t** (having in its circuit a voltaic pile), **reaction t.** (in which the currents induced in a wire coil attached to a diaphragm pass through electro-magnet coils, and thus react on the diaphragm and strengthen its action) **string t** (an acoustic telephone), **triple t.** (having its mouth-piece between two ear-pieces so as to permit talking and hearing without moving) etc

tel'e-scope, *n* **1.** An optical instrument for enlarging the image of a distant object on the retina of the eye, or, if the object is a point of light, for increasing its brilliancy, consisting essentially of two parts, an object-glass or mirror for forming an image of the object, and an ocular or eyepiece for viewing this image

There are two classes of telescopes, the **refracting telescope** and the **reflecting t.** The former transmits the rays to a focus through a combination of lenses called the object-glass, the latter brings them to a focus by reflection from a concave mirror In both kinds the real image thus formed (see IMAGE) is viewed through a magnifying eyepiece The distinctness of the image depends upon the accuracy with which all the rays from one point in the object are reunited at one point of the image This is not readily accomplished, on account of spherical and of chromatic aberration (See ABERRATION) The former is due to the fact that a spherical surface does not refract or reflect all rays to one focus, and may generally be corrected The latter can be partially corrected by achromatic lenses (see LENS), which cause the red and the violet rays to fall together, leaving the yellow-green rays nearer the lens so that the image is usually surrounded by a halo For photographic purposes the curvature of the lens is such as to focus the violet actinic rays but such an image is not suitable for the eye Eyepieces are of two kinds *positive* and *negative* (See EYE-PIECE) Telescopes of the second class focus the rays by a mirror of speculum-metal or silver on glass and are of several kinds (1) the **Newtonian t,** in which the mirror is perpendicular to the axis, and the reflected rays falling on an inclined plane mirror, are turned out to one side of the tube (2) the **Gregorian t,** in which the rays are reflected back along the axis by a small concave mirror, and are seen through a hole in the center of the large mirror, (3) the **Herschelian t,** in which the rays are reflected to the front of the telescope at the edge of the tube (See also CASSEGRAINIAN, GALILEAN) Reflectors are superior to refractors in case of construction and cheapness, in possible size, and in perfect achromatism but they are inferior in the amount of light that is available in definition, and in permanence or durability Large telescopes are now usually mounted as equatorials (See EQUATORIAL) Telescopes are sometimes named from the character of the lenses, as, **achromatic telescope, aplanatic t, dioptic t,** etc

The *Telescope* appears to have been invented by Metius a native of Holland, in 1608 Galileo hearing of the invention constructed an instrument for himself, and was the first to turn the *telescope* to practical account

tem'per-a-ment, *n* **1.** A special type of mental constitution and development or mixture of characteristics, supposed to have its basis in the bodily organism and to be transmissible by inheritance, natural disposition, the summary of intellectual and emotional tendencies

The ancient doctrine of *temperament* was developed by Galen who recognized four principal species the "full-blooded" or **sanguine,** which is warm, impressionable, and changeable the "full-phlegmed" or **phlegmatic,** which is quiet slow, and persistent, the "full-biled" or **bilious** or **choleric,** which is energetic and predominatingly objective and the "black-biled" or **melancholic,** which is sentimental and with a marked tendency to subjectivity in excessive forms While modern science recognizes the existence of marked types of mental characteristics as connected with typical forms of organic development, it is more cautious in its endeavor to assign definite causes It finds also that most individual cases are of a mixed character It places more emphasis in its attempts at explanation upon relative speed and strength of reactions dependent upon the constitution and habits of the nervous mechanism, and especially, it makes prominent the enormous complexity of the hereditary factors so far as they enter into the explanation of temperament at all

2 *Mus* The system of tuning a musical instrument so that the intervals between notes of the scale shall follow a suitable law of succession

In **pure, just,** or **true temperament** intervals between the tones are those of a mathematically perfect scale, the frequencies of vibration all having simple ratios to that of the fundamental note An instrument of fixed intonation, as the organ or piano, if tuned thus could be used in only one key, or if adapted to others would require an impracticable number of notes hence, a modification of strict intonation is adopted, the same wire or pipe being made to do duty for several slightly different notes as C, B♯, and D♭♭ This compromise is called **mean temperament.** It may be effected in various ways The most common now in use is **equal, even,** or **isotonic temperament,** in which each semitone is the mean semitone the twelfth part of an octave Various systems of **unequal temperament** formerly in vogue made the instrument usable only in certain keys, the others being much out of tune Compare also COMMATIC, 2, PITCH, and WOLF, 6

It is by virtue of good authority, therefore, that the word *'temperance* as specifically used at this day, is generally recognized as an equivalent for 'total abstinence'

The temperature of one body is said to be higher or lower than that of another according as it imparts heat or receives it from the other when the two are brought into contiguity Besides this relative criterion of temperature scientists recognize an absolute one regarding temperature as a measure of molecular motion and measuring it from the absolute zero (see ABSOLUTE), whose position is calculated from thermodynamic data and laws The air- or gas-thermometer conforms almost exactly, and the mercurial thermometer quite nearly, to this thermodynamic definition of temperature Compare THERMOMETER

The Norman conquest of England (A D 1066) led to the introduction into that kingdom of the feudal system of military land-tenures Assuming the king to be the source of all titles both of dignity and of property, grants of lands from him to his chieftains were made in consideration of military service to be rendered to himself, *i e*, to the crown, whenever required These direct grantees of the crown, tenants in chief or *in capite*, as they were styled, parceled out their grants among their followers and vassals, for like consideration of knight-service to themselves as *mesne* lords, and these again to inferior persons in consideration of various kinds of service Every lay tenure of the kingdom was thus linked with and dependent on its immediate superior grant, all culminating in the king as the lord paramount and military chief of the state This system of tenure by feuds grew in time, by its necessary divisions and subdivisions, into a most complicated system of land-tenures, which finally became so irksome that by the act of Parliament, 12 Charles II, c 24, all tenures were turned into free and common socage (see SOCAGE), except tenures in frankalmoigne, copyhold, and grand sergeanty

2. *pl* Significant or descriptive words, formal statements, set speech, as, they abused each other in no measured *terms* 3 *Logic* (1) A word, or a combination of words, such as may be the subject or the predicate of a proposition

Prepositions and articles are not terms but may help to form terms As language is of use in logic only as having meanings, the word *term* often indicates the meaning of an expression rather than the expression itself, as when we speak of understanding the terms of a proposition Logical terms may be classified by their nature or by their relations Classified by nature, they may be considered (1) as made up of marks, and hence as (*a*) **positive** or **non-positive,** according as these marks are present or absent, and (*b*) **abstract** or **concrete,** as the attributes are separated from or connected with objects or they may be considered (2) as embodying objects, and hence as (*a*) *singular* or *universal* regarding the number of objects embodied, and (*b*) *connotative* or *non-connotative* regarding the connection of the objects with their marks or they may be considered (3) as mere words, and hence as (*a*) *notative* or *symbolical,* according as they suggest or do not suggest their own marks, and (*b*) *simple* or *complex,* with regard to the number of words constituting the term Classified by relations, terms are (1) *relative* or *absolute,* according to their relations to one another, and (2) *compatible* or *incompatible,* according to their relations to the objects of which they are predicated See all the italicized words

(2) One of the three component elements of the syllogism, each of which is used twice

The **middle term** is the term through comparison of the other terms with which the conclusion embodying their agreement is reached The **major term** is the predicate of the conclusion, and is compared with the middle term in the major premise The **minor term** is the subject of the conclusion, and is compared with the middle term in the minor premise Compare SYLLOGISM, FIGURE MOOD, PREMISE, PROPOSITION

Syn. article, condition, expression, member, name, phrase, word *Term* in its figurative uses always retains something of its literal sense of a boundary or limit The *articles* of a contract or other instrument are simply the portions into which it is divided for convenience the *terms* are the essential statements on which its validity depends—as it were the landmarks of its meaning or power a *condition* is a contingent *term* which may become fixed upon the happening of some contemplated event In logic a *term* is one of the essential members of a proposition, the boundary of statement in some one direction Thus in general use *term* is more restricted than *word, expression,* or *phrase*, a *term* is a *word* that limits meaning to a fixed point of statement or to a special class of subjects, as, when we speak of the definition of *terms*, that is of the key-*words* in any discussion, or we say that is a legal or scientific *term* See BOUNDARY, DICTION

that, 1 that, 2 thăt, *a* [THOSE, 1 thōz, 2 thōs, *pl*] **1.** The (one) specially designated an emphatic word of greater definitive force than *the,* and having reference to some person or thing mentioned, understood, or definitely pointed out, as, *that* man, *that* circumstance in this use sometimes an expression of surprize or contempt, as, will you go for *that* reason? she consorts with *that* fellow **2.** Such followed by *that* or formerly by *as,* as, he was of *that* fame *that* soldiers win **3.** The (one) there correlative to *this,* an alternative or distributive use often referring to that which is more remote in order, time, or place, as, do you choose *this* or *that* book? *that* cloak is mine, and *this* one is yours

Historically *that* is a neuter inflection of the demonstrative that gave rise to the definite article *the* and retains its demonstrative, definitive, and restrictive force Its various uses have led to its classification as an adjective, pronoun, conjunction relative, and even an adverb, according to the syntactical function it appears to perform *See* THAT, *pron* THAT, *conj*

that, *pron* [THOSE, *pl*] **1.** As a demonstrative (1) The person or thing implied, mentioned, understood, or especially pointed out often used for emphasis, as, see *that,* a deed so fell as *that, those* are not mine, ah, *those* were golden days (2) The person or thing there or in the second place correlative with *this,* as, *this* or *that,* it matters not

That often refers to a phrase or a clause, or to a thought understood as a single syntactical element as to denounce dishonor, *that* was his purpose, he rides well, *that* is, he has a good seat, he will come, and *that* soon The clause it represents may be introduced by a relative as, *that* which I do ye know not now When the relative is suppressed *that* has the force of a compound or indefinite relative as "We speak *that* we do know and testify *that* we have seen" (*John* iii, 11) But in this use it has been superseded by *what* **2.** As a relative who or which now simply demonstrative and commonly introducing a restrictive clause often preceded by the definite article

In Anglo-Saxon *that* and *the* were the regular relatives, *who, what,* and *which* being only interrogatives until they gradually assumed the force of relatives, and in some uses superseded *that* Thus we say Washington, *who* was the first President, is often called Father of his country But *The* Washington *that* emigrated to this country was his ancestor In the first sentence *that* could have been used formerly in the second, *who* may be used While *who* or *which* may be governed by a preposition, *that* used relatively can not be except as a preposition may be placed at the end of a predicative clause thus we say the rumor *to which* he referred or the rumor *that* he referred *to* When *that* is used to introduce a restriction it is unemphatic and is pronounced thăt as, there is time enough for that *that* you seek This juxtaposition of the demonstrative and relative *that,* however, is commonly avoided by the use of *that-which*

In general *that* in its relative use may be regarded as *restrictive, who* or *which* as *coordinating,* in this sense *that* being often nearly equivalent to *such as* and *who* or *which* to a conjunctive phrase introduced by *and as, since* or the like as all words *that* are signs of complex ideas furnish matter of mistake signifies rather 'all words *such as* have this quality of being complex than 'all words *since they* are signs etc The uniform observance of this discrimination however, is restricted by the following limitations (1) Since *who* relates to persons only while *that* may equally well refer to things *who* is used instead of *that* even in restrictive clauses when the personal element is to be made prominent "The disciples *that* constituted the early church" is less vivid than "The disciples *who* constituted the early church." (2) Since *that* requires its governing preposition to be placed at the end of the clause, many speakers and writers prefer the use of *which* in such expressions as "the faith *that* the martyrs died *for,*" changing it to the faith for *which* the martyrs died' on the ground of dignity and ease of style (3) Since *that* is not only a relative pronoun, but also an adjective, a conjunction, and a demonstrative pronoun, *who* or *which,* or some other construction, may be used to avoid an infelicitous accumulation of *that's* in a sentence. For "I am told *that that* man *that* brought you *that* message said *that* may be substituted "I am told that the man *who* brought you the message said so" [< AS *thæt,* that, < pronom *th-* (demonst)]

that, *adv* **1.** [Colloq or Prov] In such manner or degree; so, as, I am *that* perplexed that I can not understand it.

That used adverbially is wholly inexcusable He was *that* sick,' could only be tolerated if an ellipsis such as he was (to) *that* (degree) sick' could be supposed but this is more than can be done and the expression is therefore regarded as an unpardonable vulgarism FRANK H VIZETELLY *Desk-Book of Errors in English* p 209 [F & W '11]

2. [Colloq] To such an extent or degree used with adjectives or adverbs of quantity, as, he was *that* strong

4 As a result introducing a result, consequence, or effect generally as correlative to *so* or *such,* as, he bled *so* profusely *that* he died **5.** As a consequence introducing, in elliptical form, an observation of surprize, or strong and sudden emotion, the ellipsis furnishing the reason of which this is the consequent, as, O, *that* he should use me thus! **6** Would that expressing earnest hope, and usually preceded by *O,* as, O *that* I were dead! **7.** At which time, when, as, was it not last week *that* he was to have written? the day came *that* she wept no more **8.** Used emphatically, after a preposition, adverb, or conjunction, such word itself becoming conjunctive, as, *after that* he had spoken, I do not know *but that* you are right sometimes as a Gallicism to avoid repetition of a preceding conjunction, as, altho I'm old and *that* I am weary, I am still equal to the task

That as a conjunction retains much of its force as a demonstrative pronoun and was considered by Horne Tooke and others to be oftentimes nothing else Thus the sentence 'I am told *that* you are miserable" might be transposed into 'You are miserable I am told *that*"

The germ of the theater as it arose among the Greeks was the paved *orchestra*, or circular dancing-place, for the performance of the choric dances in the worship of Dionysos The altar stood in the middle, and the open auditorium, which in Greek theaters is always built on the side of a hill, rose in tiers of stone seats (traversed by open aisles radiating from the center) in a semicircular shape about it The theater at Athens is said to have held nearly 30 000 persons As the actor became differentiated from the dancer or chorus, a platform or "speaking-place," and dressing-booths (constituting the stage-buildings or *skene*) were added at the back of the orchestra Roman architecture with its system of vaulting and arches enabled the theater to be built up from the level ground, and a combination of two semicircular theaters gives the plan of the amphitheater, as used for gladiatorial exhibitions In the Roman theater the orchestra was given up to seats for senators and distinguished persons, the scena was elaborated, the stage enlarged, a drop-curtain used, and awnings were available for shelter from rain or sun Compare illus under AMPHITHEATER The drama of the middle ages was performed in temporary booths by traveling players See DRAMA With the revival of the secular drama the first permanent playhouse in London was erected by and licensed to the father of Richard Burbage, the actor in 1576–1577, and was soon followed by the famous **Globe Theater** (identified with Shakespeare) and others The commonest plan was octagonal, with the stage in the center and boxes and pit surrounding it on every side except that of the greenroom Wooden theaters were gradually replaced by structures of stone and in the last part of the 17th century scenery was introduced

Theosophy differs from philosophy in that it starts from a transcendental apprehension of deity to explain the universe, and does not generalize from phenomena to the being and attributes of God and from religious mysticism in that it does not content itself with the relations of the soul to God, but speculates on the constitution and course of nature As a frequently recurring tendency of the mind, especially among Orientals theosophy has appeared in many forms as in the speculations of the old Egyptians and of the Neo-Platonists and Gnostics in the avatars of Brahmanism, in cabalism, and in the speculations of Schelling, Baader, Swedenborg, etc

Thorough-bass

The figures written beneath the bass notes show the shorthand method of writing the chords that are given in full in the treble

In former times much music was written thus especially in the 18th century, when the most complicated organ accompaniments were thus represented on a single staff beneath the vocal score Chords were never printed in full, as now, and every musician was expected to be able to play the entire harmony from a figured bass The system is now generally in disuse tho taught as a discipline
Down to the latter part of the 19th century the art of playing from a *thoroughbass* still survived — and even flourished — among our best Cathedral organists Turle and Goss played with infinitely greater effect from the old copies belonging to their Cathedral libraries than from modern arrangements' which left no room for the exercise of their skill W S ROCKSTRO in Grove's *Dict of Music* vol v, p 93 [MACM '10]

tide, *n.* **1.** *Astron* The periodic rise and fall, or flow and ebb, of the oceans and the waters connected with them, due to the attraction of the sun and moon

By the law of gravity the attractive force of the sun and moon decreases with the square of the distance, hence the nearer surface of the earth is attracted more strongly and the farther surface less strongly than the center, and the resultant effect is to cause a tendency to recede from the earth's center in parts of the earth just under the sun or moon and also on the side farthest from them The waters of the ocean are free to yield to this tendency, and hence tend to be heaped up into four tidal waves, two lunar and two solar, of which the lunar greatly predominate, the others being noticeable chiefly by their action in reenforcing or diminishing these As the earth turns, these waves cause two principal alternations of high and low water every 24 hours in every part of the ocean, called **flood-tide** and **ebb-t.** When the solar and lunar tides act together, the maximum tide, called **spring-t ,** takes place, when they are 90° apart there is a minimum, called **neap t.** The tidal wave is so affected by various conditions, as the configuration of coasts, the direction of winds the interference of different parts of the same wave, etc , that the resulting phenomena often become very complex

The highest *tides* take place when the sun, the moon and the earth are in the same straight line

Clay's oratory has not stood the test of *time* H C LODGE *Daniel Webster* p 201 [H M & CO 1883]

(2) *Geol* A general term indicating a subdivision of one of the grander divisions of geological history, as, Paleozoic *time* **4.** A point in duration, precise or appointed moment, instant or hour sometimes applied to a longer period considered as a point of time, date, occasion, as it is *time* to start, what *time* is it? Especially (1) The hour of death, as, he saw that his *time* had come (2) The hour of travail, as, her *time* was near **5** A portion of duration considered as having some quality or experience of its own, personal or general in the latter sense usually in the plural state of things as, the *times* are hard, it was a dull *time* **6.** (1) *Metaph* The abstract notion of continuous and limitless duration as the necessary condition of all actual occurrences, whether physical or mental and of all real existences whether material or spiritual The discussion of the origin, nature, and applicability to the real world of the time-concept has been, in the history of philosophical speculation, always closely connected with the similar discussion of the concept of space From the point of view of *psychology* there is now considerable agreement, based on solid experimental grounds, as to the facts denoting the rise and development in consciousness of the apperceptions and thoughts which lead to the formation of the abstract notion of time There are still, however, two views, with many shades of opinion between, which emphasize respectively the nativistic and the empirical factors and conditions of the total process A somewhat similar difference exists as to the *metaphysics* of the time-concept Here, as in the case of the concept of space, mathematics and the physical sciences are apt to be naively realistic, and if they do not regard time as some sort of entity, they agree approximately with Leibnitz in considering it as a system of objective and actualized relations Newton regarded absolute time after the analogy of a stream flowing on forever at a constant rate and independent of all the changes occurring in it The keen analysis of Kant, who resolved both time and space into the a priori or constitutional and necessitated way of the mind's apprehending the manifold things of sense, helped by the obvious relativity and subjective character of the ideas and conceptions of time by individual minds, has given a relative preeminence to current idealistic theories Recently various attempts have been made to harmonize the two extremes by showing how the conception of the world as the manifestation of a personal will involves the solution of the claims of both realism and idealism with respect to the reality of time

In brief only in terms of Will and only by virtue of the significant relations of the stages of a teleological process has *time* whether in our inner experience or in the conceived world-order as a whole any meaning J ROYCE *The World and the Individual* vol II p 132 [MACM '01]

And 'to be in *time*' is no more mysterious for the entire World of Reality than it is for that little fragment of reality we call ourselves G T LADD *A Theory of Reality* p 201 [S 1899]

(2) *Psychophys* The period elapsing between the application of a stimulus and muscular response to it, and usually distinguished as **association-time, choice-t, discrimination-t, perception-t, recognition-t.** Compare REACTION-PERIOD

Syn age, date, duration, epoch, era, period season, sequence, succession *Sequence* and *succession* apply to events viewed as following one another *time* and *duration* denote something conceived of as enduring while events take place and acts are done According to the necessary conditions of human thought, events are contained in *time* as objects are in space *time* existing before the event, measuring it as it passes and still existing when the event is past *Duration* and *succession* are more general words than *time*, we can speak of infinite or eternal *duration* or *succession*, but *time* is commonly contrasted with eternity *Time* is measured or measurable *duration* See OPPORTUNITY

— absolute time **1.** A system that has no reference to the particular meridian under which an event took place, but is intended to indicate the same hour by the same name in all parts of the world or **star t**, see SIDEREAL **— solar t**, same as APPARENT TIME **— standard t**, the time of a certain meridian adopted for local use over a large region instead of true local time At the International Meridian Congress held at Washington in 1884, the meridian of Greenwich England was taken as a prime meridian and 24 standard meridians differing from it by 15° of longitude, east and west, were established, so that the standard times of all countries would agree with Greenwich in minutes and seconds but differ in hours by whole numbers Clocks at any place within 7° 30′ east or west of a standard meridian are set to agree with the time of that meridian They may therefore differ by as much as a half-hour from local mean time, but the convenience for travel and commerce compensates for this In America the standard times are **Atlantic, Colonial** or **Intercolonial**, 60° W or 4 hours slower than Greenwich used in Nova Scotia and New Brunswick **Eastern**, 75° W or 5 hours slower, **Central**, 90° W or 6 hours slower **Mountain**, 105° W or 7 hours slower, **Pacific**, 120° W or 8 hours slower than Greenwich These times had already been in use by the railways of the United States and Canada since 1883, changes from one standard to another being made at the more prominent railway stations In Europe, **Greenwich t**, 0°, is used by Great Britain, Belgium, France, Holland and Spain **Mid-European t.**, 15° E or 1 hour fast, is used by Austria, Denmark Germany, Italy, Servia, Sweden, and Switzerland **East-European t**, 30° E or 2 hours fast, is used by British South Africa Bulgaria, Egypt, Roumania and Turkey The standard time for India follows meridian 82° 30′ E or 5 1/2 hours fast, while Japan takes meridian 135° E or 9 hours fast In Australia the standard time for Western Australia follows meridian 120° E or 8 hours fast South Australia meridian 142° 30′ E or 9 1/2 hours fast New South Wales Queensland Victoria, and Tasmania, 150° E or 10 hours fast New Zealand 172° 30′ E or 11 1/2 hours fast Longitude 180° practically coincides with the international date-line where, according to direction of passage the date is set ahead or back one whole day As the meridian of New York is 74° W, the local time of New York is 4 hours 56 minutes slower than Greenwich time The following list shows the local times of various capitals and other II. *The sign of the infinitive mode*

In some instances *to* is a mere sign of the infinitive and with its verb can be replaced by the corresponding verbal noun in *-ing* as he began *to beat* the drum (he began *beating* the drum) *to err* is human (*erring* is human) In Anglo-Saxon there were two similar constructions, an infinitive form, seldom used with the preposition as nīman, to take, and a gerundive form generally used with *to*, as *to* nīmanne In the latter construction *to* had a dative force of purpose or intention In passing into English this distinction was forgotten and hence arose the practise now dialectic or archaic, of governing the infinitive with *to* by another preposition as, what went ye out *for to see*? hindered *from to drink* In the same way, to express futurity, *about* is still used as, *about to come* With an infinitive *to* often indicates an indirect object or purpose *To* as an infinitive sign has not come into use (1) after the auxiliaries *do, can, may, must, shall, will*, (2) (*a*) after *dare, help, need, please, go*, as, you *dare* not jump *please* push let us *go* swim, etc, (*b*) after certain elliptical phrases, as *had rather, as lief*, as I *had rather* study now (c) after the object of *bid, feel, have, hear, let, make*, and sometimes *find* and *know*, as, *make him run* I *feel* you *tremble*, did you *find* him (*to be*) clever? I have *known* him (*to*) go there In many of these constructions *to* may be used at pleasure The word is often used colloquially to indicate an omitted infinitive or affirmation that has previously been expressed as you left your umbrella—did you *mean to*? he wrote because I asked him *to* As a sign of the infinitive, *to* not to be separated (save in exceptional cases) from its verb by any intervening word or phrase as, *to go* immediately,' not "*to* immediately *go*" See SPLIT INFINITIVE, under INFINITIVE [< AS *tō* to]

The matured leaves of the green tobacco-plant are prepared for consumption by *curing*, effected usually by exposure to air, the sun, or fire The cured leaves are allowed to absorb moisture until they become pliant They are then assorted and packed in boxes, hogsheads or bulls, where the tobacco undergoes a fermentation that develops the aroma and flavor Afterward it is worked up in the various forms suitable for market The ingredients of cured tobacco are *Nicotin* (0 63 to 5 81 per cent), *resin* and *fatty substances* (2 93 to 7 26), *glucose* (16 39 to nothing) *starch* (2 45 to 6 71), *albuminoids* (8 75 to 20 34), *pectic acid* (5 97 to 12 59), *citric acid* (0 43 to 5 80), *malic acid* (3 94 to 10 09), *oxalic acid* (0 84 to 3 49), *acetic acid* (0 31 to 1 62), *nitric acid* (3 23 to nothing), *ammonia* (0 19 to 1 65), *cellulose* (8 30 to 15 23), *sand* (0 55 to 4 17), *ash* exclusive of sand (8 19 to 18 56) A constituent called *nicotianin* gives an odor, and an essential oily or resinous matter gives flavor The analysis of the ash-constituents shows potash, soda, lime magnesia, ferric oxid, alumina manganous oxid phosphoric anhydrid, sulfuric anhydrid, silicic anhydrid, and chlorin Tobacco commercially is broadly classified in the United States as follows — CLASS I **Cigar-tobaccos** (1) *Domestic* **Connecticut tobacco**, including Havana seed and broadleaf and used for fillers and wrappers **New York State t**, including Big Flats and Onondaga, used for binders and fillers **Pennsylvania t.**, including Havana seed and broadleaf and used for fillers **Ohio t**, including Gebhardt, Zimmer, Spanish and Little Dutch, used for fillers, **Wisconsin t**, mostly used for binders **Florida t**, **Georgia t**, and **Texas t.** used for wrappers and fillers (2) *In ported* **Havana t**, including all tobaccos grown on the Island of Cuba and recognized throughout the world as the best for cigar purposes The chief types are **Vueltos** and **Semi-Vueltos** from Vuelta Abajo, grown in the province of Pinar del Rio **Partidos** in the province of Habana and a heavy-bodied variety **Remedios**, from the province of Santa Clara subdivided into **First Capaduras** and **Second Capaduras**, and used exclusively for blending with other tobaccos **Sumatra t** is used for wrappers and is classified according to districts as **Deli Langkat**, etc or according to color and quality as **Fine**, etc Other imported varieties are **Mexican t**, **Philippine t**, and **Porto Rican t.** CLASS II **Chewing-t**, **pipe t**, **cigaret-t** · (1) *Domestic* **Virginia t**, a bright-yellow tobacco used for smoking chewing and cigaret grades **North Carolina t.** and **South Carolina t**, bright-yellow tobaccos used for smoking and cigaret grades **Tennessee t**, used for snuff **Kentucky t**, **Maryland t**, **Louisiana t.** (mainly **perique t** for blending) and **Eastern Ohio t.** These are classified as **fine-cut Burley, fine-cut Mason county, white Burley, red Burley, Virginia sun-cured, Virginia flue-cured, North Carolina red fillers, Missouri air-cured fillers, Green River, Virginia yellow**, and **mahogany wrappers, lugs**, etc (2) *Imported* **Turkish t** is grown in Turkey Montenegro, Bulgaria, Macedonia, Syria and an inferior quality in Greece **Latakia t** is grown in Asia Minor and exported from Samsoun Smyrna Cavalla Bafra and Xanthe These tobaccos are used for pipe and cigaret purposes only No tobacco is grown in Egypt as its cultivation is prohibited by law Although chiefly employed for smoking and chewing tobacco finds also some use in medicine as in asthma, and occasionally as a local application as in sheep-washing, its juice being very destructive to insects In its ordinary use it acts as a narcotic Sometimes its excessive use results in nervous depression and prostration The average annual production of leaf-tobacco in the United States is 780,000,000 pounds

It is a viscid pubescent annual from 3 to 6 feet high and has large *sessile* ovate or lanceolate leaves diminishing in size from the base upward and pink funnel-shaped flowers in a terminal panicle The other principal source of the tobaccos of commerce is *N rustica* a smaller species with ovate petioled leaves and yellow flowers, called **green tobacco** from its leaves not becoming entirely brown in curing and sometimes **wild t**, from its being found wild in parts of the United States and in Mexico, where it becomes perennial It is adapted to cooler climates than *N tabacum*, and, tho native in America is grown chiefly in Europe Asia, and Africa The **Persian** or **Shiraz t** is obtained from *N. persica* Tobacco was cultivated and used in tropical America before the arrival of the Europeans who became acquainted with it on the first voyage of Columbus The first plant was taken to Spain about 1558 Jean Nicot, French ambassador to Lisbon, sent seeds from the Peninsula to Catherine de Medici, and this and his other services in diffusing a knowledge of the plant have been commemorated in the scientific name *Nicotiana*

At the outset the cultivation of *tobacco* was so lucrative that those who had no land planted in the streets of Jamestown

ton'ic sol"fa'. Of, pertaining to, or designating a system of teaching, writing, and reading music, especially vocal music, invented in England about 1812 by Sarah Glover, but developed perfected, and introduced to public notice by John Curwen in 1850 It lays especial stress on the tonal relations of the various elements of the key, and endeavors to fix them in the mind by the different mental effects they produce — *do* for instance, being called the *strong tone*, *mi* the *steady* or *calm tone*, etc In its notation there is only one way of writing a diatonic scale, namely by the initials of the syllables used in solmization (see SOLMIZATION), the absolute pitch of the key-tone being indicated at the outset Thus the staff is entirely done away with, and all reference to an arbitrary key-board is omitted The rhythmic division is into bars as in the common notation, but these are subdivided into *pulses* by colons, and, if necessary into *half-pulses* and *quarter-pulses* by periods and commas If a note is to be held over more than one pulse, it is indicated by writing a dash in these pulses Position of a note in a higher or lower octave is denoted by superior or inferior numerals In the printed scale or *modulator*, shown in the illustration, the *si* is called *te* to avoid two names having the same initial letter the central column is reserved for the essential notes, and the lateral columns explain the change of key The *fe*, *se*, etc, represent flats and sharps not involving a new key the duration of each sound is indicated by the linear space it occupies Sounds in upper and lower octaves are distinguished by superior or inferior figures as d_1, d_{11} — **tonic sol-faist,** an advocate of or expert in the tonic sol-fa system or notation

Syn. apparatus, appliance implement, instrument, machine, mechanism, utensil *A tool* is both contrived and used for extending the force of an intelligent agent to something that is to be operated upon Those things by which pacific and industrial operations are performed are alone properly called *tools* those designed for warlike purposes being designated weapons An *instrument* is anything through which power is applied and a result produced, in general usage, the word is of considerably wider meaning than *tool*, as, a piano is a musical *instrument Instruments* is the word usually applied to *tools* used in scientific pursuits, as, we speak of a surgeon's or an optician's *instruments* An *implement* is a mechanical agency considered with reference to some specific purpose to which it is adapted as an agricultural *implement*, *implements* of war *Implement* is a less technical and artificial term than *tool* The paw of a tiger might be termed a terrible *implement*, but not a *tool* A *utensil* is that which may be used for some special purpose the word is especially applied to articles used for domestic or agricultural purposes as kitchen *utensils*, farming *utensils* An *appliance* is that which is or may be applied to the accomplishment of a result, either independently or as subordinate to something more extensive or important every mechanical *tool* is an *appliance*, but not every *appliance* is a *tool*, the traces of a harness are *appliances* for traction but they are not *tools Mechanism* is a word of wide meaning, denoting any combination of mechanical devices for united action A *machine* in the most general sense is any mechanical *instrument* for the conversion of motion, in this sense a lever is a *machine* but in more commonly accepted usage a *machine* is distinguished from a *tool* by its complexity, and by the combination and coordination of powers and movements for the production of a result A chisel by itself is a *tool*, when it is set so as to be operated by a crank and pitman the entire *mechanism* is called a *machine*, as a mortising-*machine* (Compare MACHINE-TOOL, under MACHINE) An *apparatus* may be a *machine*, but the word is commonly used for a collection of distinct articles to be used in connection or combination for a certain purpose—a mechanical equipment as, the *apparatus* of a gymnasium, especially, for a collection of *appliances* for some scientific purpose, as chemical or surgical *apparatus*, an *apparatus* may include many *tools*, *instruments*, or *implements Implement* is for the most part and *utensil* is altogether restricted to the literal sense *instrument*, *machine*, and *tool* have figurative use, *instrument* being used largely in a good, *tool* always in a bad, sense *machine* inclines to the unfavorable sense, as implying that human agents are made mechanically subservient to some controlling will as, an *instrument* of Providence the *tool* of a tyrant, a political *machine*

[U S] (1) A territorial division established by law for political or municipal purposes (2) A subdivision of a county, being a quasi-corporate body, that may include villages and towns proper (3) A political division of a State

In the New England States the town is a political and corporate body created by the legislature, tho historically, in most cases, practically existing before that body It constitutes the political unit of the State, and as such sends representatives to the legislature In other States, particularly in the West, the county is the political unit, the towns (more properly townships) if any, are its subdivisions, and are established by the county authorities instead of by the legislature the counties being the units of representation In many States, particularly in the South, the town or township system is entirely wanting

Three types of rural local government are discernible in America The first is characterized by its unit the *Town* or Township and exists in the six New England States The second is characterized by a much larger unit, the county and prevails in the southern States The third combines some features of the first with some of the second, and may be called the mixed system It is found under a considerable variety of forms, in the middle and northwestern States

Beginning with Keble's sermon on "National Apostasy" in July, 1833, which declaimed against the Erastianism, rationalism, and formalism of the day, the Oxford movement or Tractarianism was the effort of the writers of the *Tracts for the Times* to show the Catholicity of the Church of England by establishing a catena of tradition between that Church and the Church of the Fathers, through the teaching of such Anglican High-church divines of the 17th and 18th centuries as Laud, Andrews, Overall, and Waterland The movement culminated in the publication of "Tract 90" which aimed at showing that the "Thirty-nine Articles" might in certain aspects be reconciled with the teaching of the Council of Trent It came to an end, or, rather, developed into the Neo-Catholic movement, when Newman, Wilberforce, Ward, and others seceded to Rome in 1845 Besides restoring ceremonial observances and emphasizing the symbolism of ritual, the movement gave strength to the claim of the Church of England to be considered a branch of the visible Church Catholic with apostolic succession and a living magisterium See NEO-CATHOLIC.

The principle that rules in tragedy and brings about the situation of extremity and desperation has varied in different ages and dramas Fate and its workings are the favorite themes of Greek tragedy, which grew out of the worship of Dionysos In Rome the germ of tragedy was found in the **comœdia palliata,** which was borrowed from the Greeks and that part of Roman tragedy which has survived is associated with Seneca whose plays free adaptations of the works of Sophocles and Euripides were designed for reading rather than for the stage The great French writers who founded the classical tragedy of France took him as their model Forms of the later Latin drama were the **comœdia togata,** which dealt with Roman life and manners, **comœdia prætexta,** named from the magisterial dress and approaching nearest to true tragedy, **comœdia trabeata,** named from the equestrian dress and **comœdia tabernaria,** which treated of tavern or low life In modern tragedy the characteristic feature is a conflict between the forces of a strong human nature *and outside forces, either* blind and physical or moral and spiritual, affording a strong contrast to the ancient Greek conception
